ABSTRACT

An architecture for a netcentric computing system is disclosed that includes a business solutions architecture layer that further includes an environment layer, a business requirements layer and a data architecture layer. An application

5   architecture layer is in communication with the business solutions layer. Further, a technical architecture layer is in communication with the application architecture layer, wherein the technical architecture layer includes an infrastructure layer and a system software layer. A platform architecture layer is in communication with the technical architecture layer, wherein the platform architecture layer includes a

10   hardware/network layer.
